

Tampere Ratikka

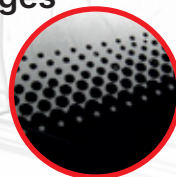

THINGS TO CONSIDER IN FULL-WRAP DESIGN

The doors open to the side

Please note that when the doors open the message taped to the doors may change. On the other hand, you can also take advantage of it in planning.

The windows have black edges

All windows have black edges and border of dots for UV protection.

Pay attention to trams direction of travel

Tampere Ratikka doesn't turn around anywhere, but moves on its route back and forth.

Because of this, the same side always appears the same regardless of the direction. Please take this into account if you are designing sides to be different from each other

The groove at the top of the trolley is not taped

There is a groove in the upper part of the carriage, between the roof and the windows. This is required for ventilation and is left untaped.

Additional markings are made on the loading hatches

Numbers (B32, B33, etc.) are taped to the hatch covers, so please take this into account in the design process.

The driver's view must not be obscured

Both side windows are left untaped.
